[GitHub Profile](#)

Analytics Engineer with a Computer Science background and 2+ years of experience owning end-to-end analytics workflows — from metric definition and instrumentation to trusted reporting and data quality validation. Proven ability to identify bottlenecks in developer and analytics lifecycles, translate stakeholder needs into scalable data models, and operate directly inside engineering codebases. Hands-on with SQL, dbt, Snowflake, Git, Python, and Claude Code. Driven by a passion for redefining how fintech and lending products are built and measured — committed to building the data infrastructure and documentation culture that helps honest, consumer-first financial products grow efficiently and intelligently.

Experiences

Technical Product Analyst, Digital Marketing

The Guitar Center Company, Westlake Village, CA: *November 2023 – PRESENT*

- Identified and resolved analytics pipeline bottlenecks during platform migration from Adobe Analytics to Google Tag Manager and Quantum Metric — defined implementation requirements, validated full event coverage, and eliminated a 3-week IT dependency by owning instrumentation directly in the React codebase.
- Built and maintained scalable analytics foundations across Adobe Analytics and GA4 — authored event specifications, defined success metrics, established QA testing protocols, and produced documentation trusted by both product and marketing stakeholders for e-commerce reporting decisions.
- Owned end-to-end analytics workflows from initial stakeholder question to final business decision — translating product questions into instrumentation specs, building trusted reporting outputs, and quantifying the impact of feature launches and marketing campaigns on e-commerce conversion and revenue.
- Designed repeatable alerting and debugging workflows using browser dev tools, network request inspection, and data layer validation to catch tracking discrepancies pre-production — improving data reliability and reducing downstream reporting errors across cross-functional teams.
- Designed and analyzed A/B experiments using Monetate and Quantum Metric — built test configurations around price, product data, and merchandising variables, defined success metrics pre-launch, and delivered findings that directly informed product and pricing decisions across e-commerce experiences.

Software Developer Co Op

RoviSys, Thousand Oaks, CA: *July 2023 – September 2023*

- Extracted and analyzed machine/process data from PI systems and industrial servers, supporting systems engineers with visibility into operational parameters across healthcare and automation environments.
- Built Python-based workflows to extract and analyze machine/process data from PI systems and industrial servers, helping systems engineers monitor operational parameters and generate business insights across healthcare and automation environments.

Helpdesk Technician

Office of Information Technology at WMU, Kalamazoo MI: *January 2023 – July 2023*

- TCP/IP, DNS, and DHCP protocols were used to diagnose and troubleshoot a complicated technical issue relating to network connectivity, which allowed the entire team to get back to work right away.
- Directed changes to the active directory domain setup, produced technical documentation and functional specs, and managed change for them. During this training, I was able to strengthen my domain management and technical documentation abilities, assuring the organization's seamless operations.

Education

Bachelor of Science in Computer Science, Western Michigan University

Graduation: August 2023

Projects

E-Commerce Analytics Pipeline — github.com/fafnanbd64/ecommerce-analytics-dbt [dbt, Snowflake, SQL, Python] — Built a modular dbt project on Snowflake modeling raw clickstream events into staging, intermediate, and mart layers covering session funnels, product page performance, and checkout conversion. Defined metric definitions, wrote schema tests and documentation for each model, and used dbt's ref() system to enforce lineage. Simulated realistic e-commerce data with Python to validate model logic end-to-end.

District Boundary Map — **Senior Design** [React.js, TypeScript, Mapbox API] — Built an interactive district boundary map extension on the Level Data Connect platform, implementing shapefile rendering and dynamic query-based map updates.

Skills

Programming & Analytics: SQL, Python, JavaScript, TypeScript, React.js, REST APIs

Analytics Engineering: Data Modeling, Data Quality Validation, Event Instrumentation, Data Layer Implementation, Metric Definitions, Analytics QA, Documentation

Tools & Platforms: Adobe Analytics, Adobe Experience Platform, Google Analytics 4, Google Tag Manager, Quantum Metric, Monetate, Tableau, Power BI, Excel

Modern Data Stack: Git, dbt (Core, Tests, Documentation, Lineage), Snowflake, Claude Code, Cursor, AWS

Experimentation: A/B Testing, Funnel Analysis, Product Analytics, E-commerce Analytics

Workflow: Agile Methodologies, Cross-functional Collaboration, Technical Requirements, Debugging
